Dear Hiring Manager,

I saw your job posting on your company website and all the requirements strongly match my background in Computer Science.

As a junior undergrad at Georgia Tech, I have been taking major specific courses and constantly developing my coding skills. My concentrations in my current CS bachelor's degree is Information Internetworks and Security and AI. My knowledge in C comes from my software architecture class as I had to code malloc and GBA games in C. I also constantly work in a Linux environment (both VirtualBox and dual boot) and am very familiar with it. I have spent a lot of time learning and understanding security topics from cryptography to TCP/IP protocols. I have begun looking into CTF competitions, and am preparing and looking forward to competing in one soon.

Aside from academics, I know I can adapt to any environment very, very quickly. While many people get stuck on the small technicalities on coding problems, I have a clear understanding of underlying problems and can code past them. In general, I hate making people wait and perform tasks quickly.

My hours/days are very flexible and I can work either on-site or telecommuting, or both. I can also start working immediately.

My resume will give a more in-depth description of my background and qualifications. I would greatly appreciate the opportunity to work with and learn from you and your talented team. I look forward to speaking with you soon.

Respectfully Yours,
Zhijian Li
